“THE SCIENCE OF LABORATORY ANIMAL IDENTIFICATION”

ID100B/1.4 Read-Only Transponder

The TROVAN ID100B/1.4 Mini Transponder is the **world's smallest** animal implantable transponder.

It is designed to provide a low impact application where a small, unobtrusive ID tag is called for. This configuration is also suitable for large scale animal applications requiring the smallest transponders and/or where extended exposure to fluids is involved.

The transponder is encapsulated in special, biocompatible glass, individually pre-sterilized and packaged in a bubble pack. It comes ready for application, in its own disposable needle and with 6 each adhesive labels featuring the ID code in human readable (alpha-numeric) and barcode 39 format. Each ID100B/1.4 Mini's code uniqueness is protected by patent.

The implant devices come in a variety of disposable and reusable designs, including syringe and gun type applicators which allow low impact, subcutaneous insertion in a wide range of animal species. In summary they provide a safe, humane, “non surgical” technique for transponder insertion, with added surety of identification.
